Vector Error Codes

Operations sheet for the Aurora Search Appliance.

This sheet lists terse operational codes that the narrative manual does not spell out.

Collection rebuild service targets depend on corpus size.

Large collections take longer than small ones.

The small-collection target is named on the next page of this sheet.

Do not guess the code from the narrative manual.

Use this sheet when an operator asks for the named service target.

Small-collection rebuild target

Code SLA-15M names a 15 minute collection rebuild service target for corpora under 50000 chunks.

If a rebuild exceeds that target, capture the appliance log and open a ticket with the collection name.

SLA-15M applies only under the stated corpus size.

Above that size, schedule the rebuild overnight instead of using this target.

Quote SLA-15M in the ticket so the queue can match the service target.
